

ABSTRACT OF THE DISCLOSURE

Method and system for recognizing as a valid receiving path a path having low level signals that conventionally is treated as useless. The valid receiving path for demodulating received signals is recognized out of a plurality of receiving paths in a CDMA wireless telecommunication system : by receiving at least one set of signals through a transmission path, the set of signals being comprised of a predetermined number of received signals. Generating at least two spread codes each of which has its own delay time, the spread code being comprised of a predetermined number of spread code bits.
